- Now, run the spring boot app, and make the request /clients in POSTAN

- When we look to the body of the return of the method findAll for the ResponseEntity, we see that is to return a List

```java
@GetMapping //endpoint GET
public ResponseEntity<List<Client>> findAll(){ //This is a endpoint to find a client by id
    List<Client> list = service.findAll();
    return ResponseEntity.ok().body(list);
}
```

- In the Request, we see that the Json return a empty List
